Submitted (JUN-2004) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: D-fructose 1,6-bisphosphate = glycerone
phosphate + D-glyceraldehyde 3-phosphate.
-!- SIMILARITY: Belongs to the class I fructose-bisphosphate aldolase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               01-AUG-1988 (Rel. 08, Last sequence update)

"Structure and expression of mouse aldolase genes. Brain-specific aldolase C amino acid sequence is closely related to aldolase A.";

Eur. J. Blochem. 156:229-2251(1986).

-!- CATALYTIC ACTIVITY: D-fructose 1,6-bisphosphate = glycerone phosphate + D-glyceraldehyde 3-phosphate.

-|- PATHWAY: Glycolysis; sixth step.
-|- SUBUNIT: Homotetramer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Necessary for preference for fructose

-!- CATALYTIC ACTIVITY: D-fructose 1,6-bisphosphate = glycerone phosphate + D-glyceraldehyde 3-phosphate.
-! SIMILARITY: Belongs to the class I fructose-bisphosphate aldolase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          01-JUN-2001 (TERMELE: 17, Last sequence update)

Submitted (JUN-2004) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: D-fructose 1,6-bisphosphate = glycerone
phosphate + D-glyceraldehyde 3-phosphate.
-!- SIMILARITY: Belongs to the class I fructose-bisphosphate aldolase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Submitted (AUG-2004) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: D-fructose 1,6-bisphosphate = glycerone
phosphate + D-glyceraldehyde 3-phosphate.
-!- SIMILARITY: Belongs to the class I fructose-bisphosphate aldolase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Rāttus norvegicus (Rat).

(XOMA ) XOMA CORP.

SP; Lei Berhard SL, Better MD, Carroll SF, Lane JA,

WPI; 1993-167617/20.

Analogues of type I ribosome inactivating protein - useful as cytotoxic agents, immuno toxins for treating auto immune diseases, cancer, graft versus host disease and selective cell killing in=vivo.

Example 10; Page 115; 163pp; English.

The invention covers analogues of the plant type I RIP gelonin which have a non-naturally occurring Cys residue in a position which enables the analogue to be conjugated via a disulphide linkage to a molecule which specifically binds to a target cell. Pref. target-cell binding molecules

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ABP41228) and to cDNAs encoding them (ABD54111-ABD56305), and also encompasses polypeptides 90% identical and polymucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen polymucleotides, antibodies against human ovarian antigens, and the use of ovarian antigen polymucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ovarian cancer; breast cancer; tumour; reproductive system disorder; infertility; pregnancy disorder; anovulation; polycystic ovary syndrome; PCOS; ovarian cyst; dysmenorrhoea; endocrine disorder; infection; inflammatory condition; immune disorder; blood disorder; infection; cardiovascular disorder; respiratory disorder; neurological disorder; gastrointestinal disorder; urinary system disorder; drug screening; gene therapy; chromosome mapping; forensic analysis; antibody preparation; cytostatic; immunomodulatory; neuroprotective; antiinflammatory; gynaecological; reproductive.
are antibodies or their fragments, esp. human engineered H65 antibody fragments. Fusion constructs were assembled that included a natural sequence gelonin gene fused to an H65 truncated heavy chain gene or an H65 light chain (kappa) gene. A DNA linker encoding a peptide segment of the rabbit muscle aldolase was inserted between the gelonin gene and the Ab gene. The resulting immunoconjugates can be used as cytotoxic therapeutic agents. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to 2175 novel human ovarian antigens (ABP41054-

disorders (e.g., infertility, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cysts, and dysmenorthoea), endocrine disorders, infertility, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cysts, and dysmenorthoea), endocrine disorders, infections (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, oophoritis and vapinitis), immune disorders (e.g., congenital and acquired immunodeficiencies, autoimmune oophoritis, systemic lupus erythematosus), blood-related disorders (e.g., anaemia), cardiovascular disorders. Close in a creamia, cardiovascular disorders, and urinary system disorders. Ovarian antigen polypeptides and oplymentatory disorders. Ovarian antigen polypeptides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polynucleotides may entitle expression or activity. The polynucleotides may entitle expression or activity. The polynucleotides may entitle and in forensic analysis, and the polypeptides may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents a human ovarian antigen of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated cancer associated nucleic acids and polypeptides - isolated using sera from cancer patients, used to develop products for the diagnosis, monitoring or treatment of cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cancer associated antigen; diagnosis; research; treatment; human; breast cancer; colon cancer; gastric cancer; renal cancer; lung cancer;

The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression broduct complexed with an HAA molecule, and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast encer.

Extracellular proteins play important roles in the formation, differentiation and maintenance of multicellular organisms. The fate of many individual cells (for example proliferation, migration or differentiation) is typically governed by information received from other cells and the immediate environment. The information is often transmitted by secreted polypeptides (for example mitogenic factors, survival factors, cytocoxic factors, differentiation factors, neuropeptides and hormones) which are received and interpreted by diverse
biological sample isolated from a subject with an agent that specifically biological sample isolated from a subject with an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disporder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides mucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and

and receptors may be of use as pharmaceutical and diagnostic agents, such as in the blocking of receptor-ligand interactions. The current invention provides the amino acid sequences of novel human membrane bound receptors and proteins, along with the CDNA sequences encoding them. The novel proteins of the invention may have cytostatic activities through the stimulation of chondrocytes. The nucleic acids of the invention may be useful for the manufacture of a medicament for diagnosing or treating a tummour in a mammal. In addition, they may be useful for measuring or detecting the expression of a tumour associated gene. The present sequence is the amino acid sequence of a human PRO protein of the
   cell receptors or membrane bound proteins. These membrane bound proteins

Identifying a mitochondrial target for drug screening assays and for treating diseases associated with altered mitochondrial function, comprises detecting a modified polypeptide in a sample and correlating with the disease.

Claim 1; SEQ ID NO 537; 180pp; English.

This invention relates to novel mitochondrial targets that can be used for therapeutic intervention in treating a disease associated with altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are

The composition is useful for treating liver disorder such as hyperlipidemmia, hypertension, type II diabetes, tumours of the liver and disorders of the inflammatory and immune response. The composition is useful for a high-throughput method of screening several molecules or compounds to identify a ligand which specifically binds a cDNA. A protein encoded by the CDNA is useful for a high-throughput method for using a protein to screen several molecules or compounds to identify at least one ligand which specifically binds the protein which involves combining the protein encoded by the CDNA with several of molecules or compounds under conditions to allow specific binding, and detecting specific binding between the protein and a molecule or compound, therefore identifying a ligand which specifically
useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including optic neuropathy (LHON), mitochondrial encephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy encephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy compositions have neuroprotective, nootropic, antidiabetic, anticonvulsant, antiarthritic, osteopathic, ophthalmological and expensive in this polypeptide sequence is a human heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Composition comprising several cDNAs that are differentially expressed in treated human C3A liver cell cultures, useful for treating liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     human; liver disorder; hyperlipidaemia; hypertension; type II diabetes; tumour; liver; inflammatory disorder; immune response disorder; high-throughput screening; differential gene expression; gene therapy.

The method comprises a search unit searching homology of a candidate sequence determined by a primer probe designing unit, for determining homologous presence or absence of a determined candidate sequence. The method of the invention is useful for the preparation of a microarray, such as a cDNA microarray. The present amino acid sequence represents a human fructose-
                       ဌ
binds the protein. The composition is useful for detecting and quantifying differential gene expression, can be used in gene therapy, to formulate prognosis and to design a treatment regimen and to monitor the efficacy of treatment. The present sequence represents the amino acid sequence of a protein encoded by a cDNA differentially expressed in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gene database production method for microarray preparation, comprises searching homology of a candidate sequence determined by a primer probe designing unit, for a matching candidate sequence.
                                                                                                                                                                                          Gaps

The present sequence is that of human fructose bisphosphate aldolase A (ALDDA), which has been identified as a cellular target for HIV inhibition. The invention relates to methods for identifying human cellular genes that encode products that are necessary for productive HIV infection for use as targets in the design of therapeutic agents for identifying biological pathways comprising the products of these pathways, and methods for identifying additional human cellular genes that encode products comprising other members of such pathways for use as targets in the design of therapeutic agents for suppressing HIV infection. It also the design of therapeutic agents for suppressing HIV infection. It also captured for identifying protective compounds that inhibit HIV infection and to the use of such compounds in the treatment or prevention of HIV. The compounds include chemical compounds such as small molecule inhibitors or substrate compounds such as products of chemical combinatorial libraries, or biological compounds including peptides, antisense molecules and antibodies. In one embodiment of the invention, the target gene encodes a target product that is a member of the compounds. The constructed from mRNA isolated from HI-60 and HE-60 an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           phytohaemagglutinin-stimulated peripheral blood mononuclear cells (PBMC) These were used for the isolation and identification of human cell-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    derived genetic suppressor elements (GSEs) exhibiting HIV suppressive activity. The human cellular genes from which these GSEs were derived were identified, and included the ALDOA gene from a PBMC library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

                                                The invention relates to human tumour-associated antigenic target (TAT) polypeptides, and their related nucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide to general sequences at least 80% identical to the TAT nucleic acids and polypeptide to polypeptides; expression vectors and host cells comprising a TAT nucleic acid; an antibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; fusion proteins comprising a TAT polypeptide; and methods and compositions for the treatment or TAT polypeptides, nucleic acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosis of cancer in mammals. TAT polypeptides and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, carvical cancer, lung cancer, cancers of the central nervous system, melanoma and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence represents a TAT polypeptide.
                                                                                                             Tumour-associated antigenic target (TAT) polypeptide PRO69617, SEQ:4521.

                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to nucleotide sequences which are useful the screening of compounds for the treatment of pain, or for the diagnosis of pain. The nucleotide sequences are up-regulated in the spinal cord in response to streptozocin-induced diabetes. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB43398 to AAB44239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidabetic; antiathmatic; antihemmatic; antibateria; antibateria; antibateria; antipathmatic; antihemmatory; antipathmatic; antihempatic; antibacterial; dermatological; neuroprotective; cardiant; thrombolytic; coagulant; conorropic; antipsoriatic and antianglogenic. The notropic; antipsoriatic and antianglogenic. The polymucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Polymucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells; to treat disorders of haematopoietic cells, autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   disorders, allergic reactions, graft versus host disease and organ rejection, modulate haemostatic or thrombolytic activity, modulate inflammation, cancers, cardiovascular disorders, neurological disease and bacterial or viral infections. The peptides, mucleotides, antibodies, agonists and antagonists may be also be used in drug screens. AAC78419 to AAC78457 and AAB44240 represent sequences used in the exemplification of

pathology in a patient. The coding sequences and proteins are also useful for monitoring the therapeutic treatment of a disease or physiological condition, such as cancer, ischaemic conditions, reperfusion injury, retinopathy, neonatal stress, preeclapmsia, atherosclerosis, inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             retinopathy, neonatal stress, preeclapmsia, atherosclerosis, inflammatory conditions, wound healing, inflammation, erythropoiesis or hair loss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  second specialised cell type, under two experimental conditions, and dentifying a gene that is differentially regulated in the two specialised cell types under experimental conditions. ABV7813-ABV78116 and ABP65061-ABP65257 were identified using the methods of the invention. The coding sequences and proteins are useful for treating a disease in a patient, for manufacture of a medicament for treating hypoxia-regulated conditions, and for regulating tumourigenesis, angiogenesis, apoptosis, biological response to hypoxia conditions, or hypoxic-associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Huntington's disease; osteoarthritis;

This invention relates to novel mitochondrial targets that can be used for therapeutic intervention in treating a disease associated with altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, osteoarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial concephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRE) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic, anticonvulsant, antiarthritic, osteopathic, ophthalmological and cytostatic activities. This polypeptide sequence is a human heart mitochondrial protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying a mitochondrial target for drug screening assays and for treating diseases associated with altered mitochondrial function, comprises detecting a modified polypeptide in a sample and correlating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Glenn GM;

The invention relates to a combination comprising cDNAs that are differentially expressed in response to steroid treatment. Also included are the following: a high throughput method for using a cDNA to detect differential expression of nucleic acids in a sample; and a high to detect throughput method of screening molecules or compounds to identify a ligand that specifically binds a cDNA. The sample is from a subject with Wilson disease and comparison of a strandard defines a stage of that disease. The high throughput method of screening molecules or compounds to identify a ligand that specifically binds a cDNA comprises: combining the combination with molecules or compounds under conditions to allow specific binding; and detecting specific binding between each cDNA and at least one molecule or compound. The molecules or compounds are regulatory proteins. The combination is useful for preparing a composition for treating liver disorders associated with steroid therapy, e.g., cirrhosis or hepatitis. The present sequence represents a human protein which is differentially expressed in steroid-induced cDNA liver cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 56, Application US/08646360
Patent No. 5837491
GENERAL INFORMATION:
APPLICANT: Better, Marc D.
APPLICANT: Studinka, Gary M.
TITLE OF INVENTION: Immunotoxing Comprising Ribosome-Inactivating TITLE OF SEQUENCES: 173
CORRESPONDENCE ADDRESS: ADDRESS: ADDRESSE: MCANdrews, Held & Malloy, Ltd.
APPLICANT: Studnika, Gary M.
TITLE OF INVENTION: Immunotoxins Comprising Ribosome-Inactivating
TITLE OF INVENTION: Proteins
NUMBER OF SEQUENCES: 169
CORRESONDENCE ADDRESS:
ADDRESSEE: MCANdrews, Held & Malloy, Ltd.
STREET: 500 West Madison Street, 34th floor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Length 20;
                                                                                                                                                                                                                                                            COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/477,484B
FILING DATE: 07-JUN-1995
CLASSIFICATION DATA:
APPLICATION NUMBER: US 08/425,336

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 56, Application US/09711485

Patent No. 6649742

GENERAL INFORMATION:

APPLICANT: Better, Marc D.

APPLICANT: Carroll, Stephen F.

APPLICANT: Studnika, Gary M.

TITLE OF INVENTION: Immunotoxins Comprising Ribosome-Inactivating

TITLE OF INVENTION: Immunotoxins Comprising Ribosome-Inactivating

TITLE OF INVENTION: Proteins

NUMBER OF SEQUENCES: 169

CORRESPONDENCE ADDRESS:

ADDRESSE: McAndrews, Held & Malloy, Ltd.

STREET: 500 West Madison Street, 34th floor

CITY: Chicago

STATE: Illinois
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ouery Match 100.0%; Score 114; DB 3; Length 20; Best Local Similarity 100.0%; Pred. No. 1.9e-12; Matches 20; Conservative 0; Mismatches 0; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                COUDTRY: USA
ZIP: 60661
COMPUTER REDABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/09/711,485
FILING DATE: 18-AUG-1998

Patent No. 6060281

GENERAL INFORMATION:
APPLICANT: Grave, Robert B.
APPLICANT: Frank, Glenn R.
APPLICANT: Wishewki, Nancy
TITLE OF INVENTION: NUCLEIC ACID MOLECULES
NUMBER OF SEQUENCES: 55
NUMBER OF SEQUENCES: 55
NUMBER OF SEQUENCES: 55
SERRET: 1700 Lincoln Street, Suite 3500
                                                                                                              Query Match
31.6%; Score 36; DB 2; Length 16;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

(XOMA ) XOMA CORP.

SP; Lei Lane JA, Carroll SF, Better MD, Berhard SL,

WPI; 1993-167617/20.

Analogues of type I ribosome inactivating protein - useful as cytotoxic agents, immuno toxins for treating auto immune diseases, cancer, graft versus host disease and selective cell killing in=vivo.

Example 10; Page 114; 163pp; English.

The invention covers analogues of the plant type I RIP gelonin which have a non-naturally occurring Cys residue in a position which enables the analogue to be conjugated via a disulphide linkage to a molecule which specifically binds to a target cell. Pref. target-cell binding molecules are antibodies or their fragments, esp. human engineered H65 antibody

ABR82616-17 represent fluorescent labelled peptide substrates used to detect the presence of P. aeruginosa using a protease assay

initiated early enough to prevent more serious infection. Sequences

The method involves contacting the sample with a detectably labeled substrate for an enzyme produced and/or secreted by microorganism, which results in modification of substrate by enzyme and detecting the modification or the absence of the modification of substrate. The method is useful for detecting the presence or absence of microorganism in a sample e.g. wound-specific bacteria selected from S. aureus, S. epidermidis, Streptococcus pyogenes, P. aeruginosa, Enterococcus faccalis, Proteus mirabilis, S. marcescens, Enterobacter clocae, Acetinobacter aniratus, Klabeiella pneumonia and E. coli in wound or body fluid. The system detects the early stages of infection before the symptoms develop. Therefore appropriate antimicrobial therapy can be
                               sequence gelonin gene fused to an H65 truncated heavy chain gene or an H65 Light chain (kappa) gene. A DNA linker encoding a peptide segment of the E.coli shiga-like toxin was inserted between the gelonin gene and the Ab gene. The resulting immunoconjugates can be used as cytotoxic therapeutic agents. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Microorganism detection; antimicrobial therapy; DNA metabolism; protease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detection of microorganism in sample e.g. wound and body fluid, by contacting sample with detectably labeled substrate for enzyme produced and/or secreted by microorganism, and detecting modification or absence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to the crystal structures of human mitogen activated protein (MAP) kinase activated protein kinase 2 (MKZ), and the use of these structures in drug design. Also disclosed are the polymucleotide sequence encoding MKZ, a vector comprising the polymucleotide, a transformed host cell transfected or infected with the vector, and a method of producing crystallised MKZ. The crystallised MKZ is useful as a therapeutic agent in treating inflammatory based diseases. The present sequence represents Salmonella typhosa LSP-1 peptide. The peptide is used in the kinetic analysis of MKZ.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Svenson K,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 38; DB 8; Length 16; Pred. The products of the invention have antihelminthic activity and can be used in vaccines.

(I) is useful for protecting the animals from diseases caused by parasitic helminth, for preventing the spread of onchocerciasis, heartworm and/or filariasis by administering it to vectors such as mosquitoes, in which the parasitic helminth infections. This sequence reagents for detecting parasitic helminth infections. This sequence represents a Dirofilaria immitis P22U protein tryptic fragment

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AABO8745-61 represent peptides derived from a parasitic helminth phospholipase A2-like protein (PLA2), designated PDiPLA2-150. The enzyme catalyses the hydrolysis of the 2-acyl ester group of sn.3-glycerophospholipids. The polypeptide has a role in lipid metabolism, membrane synthesis, and parasite remodelling and migration. The PLA2 polypeptides are useful for identifying inhibitors. They are also useful for treating or preventing diseases such as onchocerciasis, filariasis caused by a parasitic helminth in animals preferably dogs, cats, humans, ferrets, horses, cattle, sheep, etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                       Peptide derived from a helminth phospholipase A2-like protein (PLA2)
                                                                                                                                                                                                          Helminth; phospholipase A2-like protein; PLA2; membrane synthesis; sn-3-glycerophospholipid; lipid metabolism; parasite remodelling; parasite migration; onchocerciasis; filariasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 36; DB 3; Length 16;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to parasitic helminth phospholipase A2-like (PLA2) proteins and the nucleic acids encoding them. The invention includes a method for identifying a compound that is capable of inhibiting phospholipase A2 activity of a parasitic helminth, comprising contacting an isolated parasitic helminth PLA2 protein with a putative inhibitory compound under conditions in which, in the absence of the compound, the protein has phospholipase A2 activity and determining if the putative inhibitory compound inhibits the phospholipase A2 activity The composition is useful for protecting an animal from infection caused by a parasitic helminth such as Dirofilaria immitis. This sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                       Parasitic helminth; phospholipase A2; PLA2; parasitic infection;

The present invention describes a library of display vectors comprising a plurality of DNA molecules that comprise a general structure: R1-Z-R2, plurality of DNA molecules that comprise a general structure: R1-Z-R2, where R1 and R2 is a constant region that includes a cleavage site for a restriction endonuclease. Also described: (1) obtaining a binding peptide, comprising: (a) selecting for plage in the above library, where a displayed peptide binds to a target of interest; (b) obtaining RF DNA for the selected phage; (c) cleaving the library RF DNA tragments for the selected RF DNA tragments; (e) cligating the mixed fragments; (e) ligating the mixed fragments; (f) introducing the ligated fragments into cells, such that phage displaying a new library are produced; and (g) cobtaining the binding peptide, (2) producing a modular phage display cobtaining the binding peptide; (2) producing a modular phage display library. The methods are useful for obtaining a recombinatorial phage display a modular phage display library, and producing a recombinatorial phage display containing a pinding peptide, producing a modular phage display library, and producing a recombinatorial phage display containing a pinding peptide, producing a modular phage display library. The library of display vectors is useful in isolating binding percent for a target molecule. The present sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      KDR & VEGF/KDR complex binding peptide of an MTN13 peptide library ID241.
                                                                                                                                                                                                                                                                                                                                                                   늉
